You're Building the System. Let Us Handle the O-Rings!

AIS seal installation modules integrate **directly** into your automation design.

Somewhere in your build, there's an o-ring installation step. It's not the interesting part of the project. It's not where your engineers want to spend their time. And if it fails in the field, it fails expensively.

AIS builds the module that takes that problem off your plate, and off your risk register.

Drop it in your line.

Move on.

AIS modules ship tuned, tested, and ready to integrate. Compact footprint, multiple PLC and communication options, and no custom tooling development on your end. It fits in your build because it was designed to.

Proven in OEM production.

Not a prototype, but a promise.

AIS machines are already running in production environments across automotive, medical device, aerospace, and industrial manufacturing. Tens of thousands of applications since 1978. When you spec AIS, you're spec'ing something with a track record.

Free your engineers!

For the work that wins the project.

O-ring installation is a solved problem. Stop spending design cycle hours on it. AIS handles the sealing so your team can focus on the automation that actually differentiates your system.

One less variable.

One better machine.

An assembly line is only as consistent as its weakest operation. An AIS module eliminates seal installation as a variable. The machine you deliver performs better because that one step was never left to chance.

The highest failure rate operation in your build is not yours to own.

O-ring installation is where field failures start. AIS machines use a proven radial stretch method built specifically for seal reliability. When you spec AIS, you transfer that performance responsibility to a company that has done nothing else for over 40 years. Your customer gets a better machine. You get fewer support calls.

AIS offers external and internal seal installation modules for semi-automatic and fully automated production lines, including the ASP series, ISP series, Variable Placement Module, and the ASP-1 HD-AM for continuous-duty automated assembly.

Not sure which fits your application?

That's what we're here for!
